

Security is now at the very heart of business strategy for many companies. Integration and centralisation enables businesses to optimise all aspects of building security and staff / visitor safety cost effectively. Investing in the appropriate solution is therefore critical, whilst enhancing the access, safety and security of your buildings. Fuse software allows simple integration with the following systems

Access control (wired and standalone battery operated)

Using the advanced features of the Fuse software and our growing range of distributed intelligence door controllers (which includes the latest hybrid Fuse Controller). You can unleash the combined benefits offered by a fully featured traditional hard wired card reader and lock control solution. As well as the flexibility and agility of secure wireless battery powered Fuse locksets and e-cylinders.

Graphical Mapping

The workstation can display detailed colour graphic images of the site incorporating custom made equipment icons to indicate the current status of the actual equipment connected to the system. Equipment pads can also be created and then selected on the screen to allow the operator direct control of field equipment. Activation of on screen icons will allow the operator to control external devices such as door overrides, CCTV equipment and intercoms. In this manner a 'virtual' security console can be created on screen, allowing intuitive control over remotely located equipment

The guard tour patrol management and monitoring facility

The solution allows an operator to create

unique routes or tours for each patrol. Tours can be defined with as many way-points as necessary for a given route.

CCTV

Through the use of the Fuse virtual control room software, a Fuse access control system can provide a cost effective solution for applications that require the graphical display of alarm events and integration of these events with a CCTV matrix or digital video recorder.

Intruder Alarm integration

IP connectivity to Fuse allows full monitoring of alarm status (who and what time the alarm was set / unset). Graphical images of alarm devices are simply created and deployed to the graphical mapping allowing the operator to view/control the equipment field.

Asset Protection

Long range RFID loss prevention/tagging system with real-time owner to asset matching.

Visitor registration

Touch screen visitor self-registration system with web based host pre-registration and integrated telephone based voice notification.

Lone worker

Card reader based protection for lone workers with integrated mobile phone verification.

Fire evacuation mobile muster station

Tablet PC based roll call mustering system with built in card readers. Building users evacuating a building would simply register their staff/visitor card upon reaching designated muster point.
